

“Colombo Shoe Fair” is an annual event held in Sri Lanka, attracting thousands of shoe lovers each year. Due to the growing demand and high visitor turnout, managing the crowd efficiently has become a challenge. To address this, the management team of the Colombo Shoe Fair has proposed an **online booking system** for visitors. Through this system, customers can browse and book footwear items **before visiting the fair**.

All available items are displayed as a menu to the user, and each user can reserve any number of items from the table below. Once the booking is completed, the system will generate a **unique order number** for each booking, along with the **total bill** for the order.

For payments, the management has introduced two options:

1. **Online Payment** – A 3% processing fee will be added to the total bill.
2. **On-site Payment** – Visitors can pay in person upon arrival.

If a user chooses to pay on-site, they are allowed to **add more items to the same order number** during their visit. It needs to have the facility to search any order with detailed information via the given order number in the system. Once all items are finalized, the total bill will be updated accordingly and payment can be made.

At the end of the Shoe Fair, the system should be able to calculate the **total revenue** generated from all bookings and purchases.

Below is the list of items available at the Shoe Fair:

Item Code	Item	Unit Price (LKR)
S001	Men’s Leather Shoes	5,500.00
S002	Women’s Heels	4,000.00
S003	Casual Sneakers	3,200.00
S004	Children’s Sandals	2,000.00
S005	Running Shoes	4,800.00
S006	Flip-Flops	1,200.00

Note: Assume only these items are available for the purpose of this implementation. If needed you could hypothetically increase the use case but the core ideas need to remain same.
